

ARCOX DEX PLATFORM

ARCOX DEX is a multi-chain decentralized exchange and settlement infrastructure built on Arc Testnet, powered by Circle AppKit, CCTP, and Autonomous AI Agent Routers. It unifies self-custody EOAs with developer-controlled Circle Wallets to deliver instant cross-chain liquidity and paywall-protected intelligence APIs.

Powered by Arc Network & Circle App Kit

FEATURE OVERVIEW

The ARCOX DEX entry hub provides an intuitive 3-step onboarding guide (Connect Wallet, Fund & Bridge, Trade & Swap) alongside direct launcher actions. It introduces users to self-custody wallet connection and prepares the automated proxy Circle Wallet for institutional-grade operations.

PURPOSE & WORKFLOW

Guide first-time and institutional users into multi-chain DeFi liquidity.

BUSINESS VALUE

Reduces onboarding drop-off rate by 70% via guided steps and zero-friction wallet integration.

ROUTE: /portfolio

Consolidated Multi-Wallet Portfolio Management

Balances & Asset Overview Panel

FEATURE OVERVIEW

Provides absolute visibility across connected MetaMask EOA holdings, Circle developer-controlled proxy wallet balances, and aggregated Unified Balance pools. Supports USDC, EURC, USYC yield tokens, and cirBTC with real-time balance polling.

PURPOSE & WORKFLOW

Eliminate balance fragmentation across isolated account abstraction layers.

BUSINESS VALUE

Seamless balance reconciliation across self-custody and smart account layers.

Institutional Token Swap & Smart Order Routing

Decentralized Exchange Engine

FEATURE OVERVIEW

High-speed token exchange on Arc Testnet for native stablecoins (USDC, EURC) and institutional synthetic assets (USYC, cirBTC). Features automatic rate quotation, low-slippage execution, and transaction history logging.

PURPOSE & WORKFLOW

Provide deep liquidity and low-latency token exchange on Arc Testnet.

BUSINESS VALUE

Captures trading fees while ensuring minimal price impact and instant finality.

ROUTE: /bridge

Circle CCTP Cross-Chain Asset Bridge

Native Multi-Chain Liquidity Router

FEATURE OVERVIEW

Leverages Circle CCTP (Cross-Chain Transfer Protocol) and Arc DEX bridge APIs to transfer native USDC and assets seamlessly between Arc Testnet, Ethereum Sepolia, Base Sepolia, Arbitrum Sepolia, HyperEVM, and Solana Devnet.

PURPOSE & WORKFLOW

Enable zero-slippage cross-chain liquidity movement without synthetic wrapped tokens.

BUSINESS VALUE

Eliminates bridge hack vulnerabilities by relying on Circle burn-and-mint attestations.

Bridge from

Circle Wallet 12450.0000 USDC		EOA MetaMask 8900.0000 USDC

Peer-to-Peer Transfers & Corporate Payout Engine

Direct Token Disbursement Panel

FEATURE OVERVIEW

A direct payout module designed for instant token transfers (USDC, EURC, USYC, cirBTC) to any EVM target address. Includes automatic gas estimation, recipient validation, and transaction tracking.

PURPOSE & WORKFLOW

Facilitate fast, low-cost P2P transfers and automated corporate disbursements.

BUSINESS VALUE

Powers payroll, vendor payments, and web3 automated disbursements with minimal gas.

FEATURE OVERVIEW

Powered by Circle AppKit, this module aggregates USDC holdings distributed across multiple testnets into a single, unified balance sheet. Users can inspect chain breakdown, deposit funds, and estimate spend limit.

PURPOSE & WORKFLOW

Abstract away multi-chain friction for users and autonomous agents.

BUSINESS VALUE

Unlocks frictionless multi-chain spending without requiring manual chain switching.

ARCOX DEX DOCS

User Guide

A short ARCOX DEX guide for wallets, swap, bridge, send, receive, agent jobs, and bridge recovery.

A pending bridge does not mean funds are lost

CCTP bridging has several stages: approve, burn, attestation, then mint/receive on the destination chain. If burn succeeded but mint is pending, the funds are waiting for attestation or the receive transaction. Do not burn the same amount again before checking Retry Center.

1. Open Info, then check Bridge Retry Center.
2. If the transaction appears there, press Retry Mint after your wallet is on the destination chain.
3. Make sure the wallet has testnet gas on the destination chain. Arc uses USDC as gas, other EVM testnets use test ETH.
4. If retry fails, copy the burn tx hash and wait a few minutes before retrying. Attestation may not be ready yet.

Getting started

Connect MetaMask from Connect Wallet. The app asks for a login signature to prove wallet ownership, then prepares the Circle Wallet proxy when available.

1. Keep MetaMask active.
2. Use the testnet requested by the app.
3. If Circle Wallet is missing, press Retry setup in the header.

Balances and wallets

The header shows MetaMask, Circle Wallet, E-USDC, E-clrBTC, and Circle balances when present. E means EOA/MetaMask balance, C means Circle Wallet proxy balance.

Swap

Swap uses the user wallet for EOA transactions. Always create a quote/estimate before swapping. If no route is available, change token, amount, or try again later.

Bridge

Bridge moves supported tokens across testnets through Circle CCTP. The normal flow is approve, burn, wait for attestation, then mint on the destination chain.

1. Choose source and destination chains.
2. Choose Circle Wallet or EOA as the funding source.
3. Enter amount, check estimated receive, then follow wallet popups.
4. Wait for mint to finish before refreshing balances.

Solana bridge

Solana users must use Solana Devnet. Use Solflare or Phantom Devnet. Bridge from or to Solana requires Solana wallet signatures for burn/mint.

Send

Send transfers tokens from Circle Wallet proxy or EOA. For EOA, the transaction must be signed by the user wallet.

Receive

Receive shows the receiving address and generates a unique QR code to receive funds.

ARCOX Pay

ARCOX Pay uses QR codes to receive funds from a mobile device.

FEATURE OVERVIEW

Comprehensive documentation covering wallet setup, CCTP workflow mechanics, troubleshooting matrices, and Agent Model Context Protocol (MCP) server integration guidelines.

PURPOSE & WORKFLOW

Accelerate developer onboarding and third-party system integration.

BUSINESS VALUE

Expands developer ecosystem adoption and enables seamless AI agent integrations.

• Mint TX (Base Sepolia): 0x2a8eef7f67494ed4076f9e8bdcce114779396c5df61201396653863841ed5e

1 USDC sudah masuk ke Base Sepolia. RPC dan CCTP bridge route berfungsi normal end-to-end.
```

Extracted directly from Hermes SQLite database (session 20260723_161207_356e3a14): User tests agent RPC node -> Agent verifies balance (47.49 USDC) -> User requests real bridge -> Hermes generates Preview Card (arcx-preview-46f816e6611b6a20) -> User confirms "ya" -> Hermes executes CCTP approve, burn & mint.

1. User Request (Real Log)

User enters "Test rpc yang di dipakai agent" & "Coba real tx bridge". Hermes checks RPC node & balance (47.49 USDC).

2. Real Preview Card

Hermes outputs structured Preview Table: 1 USDC Arc Testnet -> Base Sepolia, Preview ID: arcx-preview-46f816e6611b6a20. Requests "ya" confirmation.

3. Real Execution Log

User confirms "ya". Hermes executes CCTP: Approve Tx (0x1ee9...), Burn Tx (0x05ba...), Mint Tx (0x2a8e...). 1 USDC delivered to Base Sepolia.

x402 Micropayment Engine: Real Hermes DB Session Log

Real Hermes Session 20260722_083753_4e5760e7 [x402 Settlement]

Extracted directly from Hermes SQLite database (session 20260722_083753_4e5760e7): User asks why x402 payment returned no result -> Hermes diagnoses backend Vercel TTL expiration -> User instructs "Perbaiki, dan test sampai mengeluarkan result" -> Hermes patches reconciler & verifies Arc USDC memo contract settlement -> Status marked PAID & result unlocked.

1. User Bug Report (Real Log)

User asks "Mengapa pembayaran x402 tidak mengeluarkan result? Sudah di bayar tapi status tidak berubah paid di frontend maupun agent".

2. Hermes Diagnosis

Hermes inspects invoice arcox_x402_2d0a4bd8915a4c72, identifies trustedGatewaySpend flag gap & TTL 300s expiration.

3. Real Fix & Settlement

User instructs "Perbaiki...". Hermes patches reconciler, passes 12/12 unit tests, settles Arc USDC memo contract, marks status PAID & delivers unlocked result.

CCTP Bridge Architecture: Real Hermes EVM -> Solana Bridge

Real Hermes Session 20260723_161207_356e3a14 [Solana Devnet Bridge]

Hermes CLI -- Session 20260723_161207_356e3a14 [Uji RPC Agent ARCOX & Bridge] REAL HERMES SESSION LOG

1 USDC sudah masuk ke Base Sepolia. RPC dan CCTP bridge route berfungsi normal end-to-end.
```

Extracted directly from Hermes SQLite database (session 20260723_161207_356e3a14): User requests "Test 1 usdc arc ke solana" -> Hermes outputs Preview Card (arcx-preview-f8817536d46bff4b) -> User confirms "ya" -> Hermes executes CCTP EVM->Solana: Burn on Arc Testnet, Circle Attestation, Mint on Solana Devnet (recipient 4kAf2Qxf9KnbNko7ukPMMu8q1UButJYNik4yQtvWhExw).

1. User Request (EVM->Solana)

User enters "Test 1 usdc arc ke solana". Hermes checks route support & EOA balance (46.49 USDC).

2. Real Preview Card

Hermes generates Preview Card for Arc Testnet -> Solana Devnet (recipient 4kAf2Qxf...), Preview ID: arcx-preview-f8817536d46bff4b.

3. Real Execution Log

User confirms "ya". Hermes executes CCTP EVM->Solana: Approve Tx, Burn Tx (0xd79c...), Mint Tx on Solana Devnet (tx: 3273uLrt...).

INVESTOR SUMMARY

Investor Summary & Financial Growth Roadmap

Key Differentiators & Investment Highlights

ARCOX DEX combines native Circle CCTP liquidity, autonomous AI Agent routing, x402 micropayment monetization, and merchant checkout into a single high-performance DeFi platform on Arc Testnet.

Circle CCTP Integration

Zero synthetic bridge risk with native burn-and-mint settlement.

Autonomous AI Engine

Intent-based trade routing and enterprise background worker execution in Hermes CLI.

x402 Data Monetization

HTTP 402 paywall intelligence APIs generating recurring protocol revenue.

Turnkey Commerce Pay

Instant merchant payment checkout & developer sandbox testing console.
